**The exam is closed book and closed notes.**

The water in an aboveground swimming pool is to be emptied by unplugging a 3-cm-diameter horizontal pipe attached to the bottom of the pool. Assuming that point 1 at the free surface of the pool and point 2 at the exit of pipe are open to atmosphere with a vertical distance of 2m, determine the maximum flow rate of water through the pipe.

Bernoulli's equation: $\dfrac{P_1}{\rho g} + \dfrac{V_1^2}{2g} + z_1 = \dfrac{P_2}{\rho g} + \dfrac{V_2^2}{2g} + z_2$
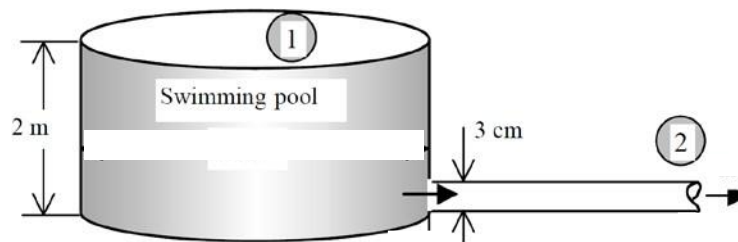

Solution

Assumptions **1** The orifice has a smooth entrance, and all frictional losses are negligible. **2** The flow is steady, incompressible, and irrotational with negligible frictional effects (so that the Bernoulli equation is applicable).

(1)

Analysis We take point 1 at the free surface of the pool, and point 2 at the exit of pipe. We take the reference level at the pipe exit ($z_2 = 0$). Noting that the fluid at both points is open to the atmosphere (and thus $P_1 = P_2 = P_{atm}$) and that the fluid velocity at the free surface is very low ($V_1 \cong 0$), the Bernoulli equation between these two points simplifies to

$$\frac{P_1}{\rho g} + \frac{V_1^2}{2g} + z_1 = \frac{P_2}{\rho g} + \frac{V_2^2}{2g} + z_2 \quad \overset{(3)}{\rightarrow} \quad z_1 = \frac{V_2^2}{2g} \quad \rightarrow \quad V_2 = \sqrt{2gz_1} \quad \textbf{(1)}$$

The maximum discharge rate occurs when the water height in the pool is a maximum, which is the case at the beginning and thus $z_1 = h$. Substituting, the maximum flow velocity and discharge rate become

$$V_{2,max} = \sqrt{2gh} = \sqrt{2(9.81\,\text{m/s}^2)(2\,\text{m})} = 6.26\,\text{m/s} \quad \textbf{(1)}$$

$$Q_{max} \overset{(1)}{=} A_{pipe}V_{2,max} = \frac{\pi D^2}{4}V_{2,max} \overset{(0.5)}{=} \frac{\pi(0.03\,\text{m})^2}{4}(6.26\,\text{m/s}) = 0.00443\,\text{m}^3/\text{s} = \textbf{4.43 L/s} \quad \textbf{(0.5)}$$
